

GAURI RAHUL SHINDE

B.Tech CSE - AI & Analytics | MIT ADT University, Pune

7558420605 | shindegauri2005@gmail.com | Pune, India | [linkedin.com/in/gaurishinde6283](https://www.linkedin.com/in/gaurishinde6283) | github.com/GauriShinde911

PROFESSIONAL SUMMARY

AI & ML practitioner with hands-on experience in Python, prompt engineering, LLMs, and full-stack AI application development, deploying ML models, software documentation, and remote independent work. Currently building a production enterprise platform as an embedded systems intern and a published co-author on an AI-powered recommendation system.

TECHNICAL SKILLS

Languages: Python (Skilled), Java (Basic), SQL (Intermediate), HTML/CSS

AI / ML: Prompt Engineering, LLMs, RAG, Generative AI, Scikit-learn, TensorFlow, PyTorch, NLP, Computer Vision, pandas, NumPy

Tools & Platforms: Git/GitHub, OpenCV, U-Net, ChatGPT, Gamma, Power BI, Tableau, Antigravity

EXPERIENCE

Embedded Systems Intern | Delta IoT Solutions Pvt. Ltd. | Pune

July 2026 - Present

- Sole developer engaged by the client to build Mission Specialist (DEMS), a full-stack enterprise platform covering annotator performance analytics, candidate skill certifications, daily work telemetry, attendance monitoring, defect-inspection auditing, and shift-roster scheduling.
- Built the system on React 19, TypeScript, Vite, and TailwindCSS on the frontend, with Node.js/Express, Prisma ORM, and PostgreSQL on the backend, including Socket.io real-time sync and a public TV wallboard kiosk display.
- Delivered security hardening (JWT auth, CORS, rate limiting, Gmail OTP login), migrated the data layer from SQLite to PostgreSQL with tracked Prisma migrations, and implemented role-based access control with audit logging and soft delete.

Internship in progress; a completion letter will be issued by Delta IoT Solutions on finishing.

SAP ERP Intern | Expound Technivo | Remote

June - July 2025

- Observed and understood the Z_EMPLOYEE_MASTER data schema and core SAP module structure by shadowing client requirement-gathering sessions.
- Learned to navigate and execute SAP transaction codes (T-codes) for master data entry and reporting.

PROJECTS

1. Smart Tiffin Services - Full-Stack Web App (2026) | React, Vite, Tailwind CSS, Supabase, Leaflet, JavaScript

An AI-assisted tiffin delivery platform connecting home-cooks with subscribers, with rule-based recommendation, demand-forecasting, and pricing engines that personalise meal suggestions and reduce food wastage.

Published as: "AI-Powered Personalized Nutrition and Home-Food Platform," World Journal of Innovative Research (WJIR), Vol. 20, Issue 4, pp. 35-41, April 2026. DOI: [10.31871/WJIR.20.4.15](https://doi.org/10.31871/WJIR.20.4.15)

- Built a full-stack delivery platform with a React + Vite front-end and Supabase (PostgreSQL, Auth, REST API) as the backend; integrated Leaflet for live delivery-tracking maps.
- Designed a multi-factor meal recommendation engine scoring dietary preference, mood, nutrition targets, cook rating, and allergy safety to personalise suggestions and address the cold-start problem for new users.
- Built demand-forecasting, taste-memory, and fair-pricing modules that analyse order history and neighbourhood trends to reduce food waste and guide cooks' pricing decisions.

2. Smart Agriculture AI - Weed Detection in Wheat Crops (2026) | Python, PyTorch, OpenCV, Albumentations, U-Net

A computer-vision pipeline that distinguishes weeds from wheat in crop-field images using a U-Net segmentation model, with training masks generated automatically through classical colour-based image processing.

- Built an automatic mask-generation pipeline using OpenCV HSV/LAB colour-space thresholding and morphological filtering to label wheat vs. weed regions without manual annotation.
- Trained a U-Net segmentation model in PyTorch with a combined Dice + BCE loss, AdamW optimizer, and cosine learning-rate scheduling over 50 epochs, using Albumentations for data augmentation.
- Evaluated segmentation quality using the IoU (Intersection-over-Union) metric on a held-out validation set, tracking best-checkpoint performance across training.

3. AI-Powered Interior Design Recommendation System (2024) | Python, Scikit-learn, JS, HTML/CSS, REST API, pandas, NumPy

- Built content-based recommendation engine (text vectorisation, cosine similarity) with responsive web interface via REST API.
- Independently solved cold-start problem using hybrid content-based filtering with style-tag defaults, significantly improving new-user relevance.

4. AI-Powered Smart Rental Platform (2025) | Python, Collaborative & Content-Based Filtering, pandas, NumPy

- Developed tenant-property matching system using collaborative and content-based filtering with scalable data architecture.
